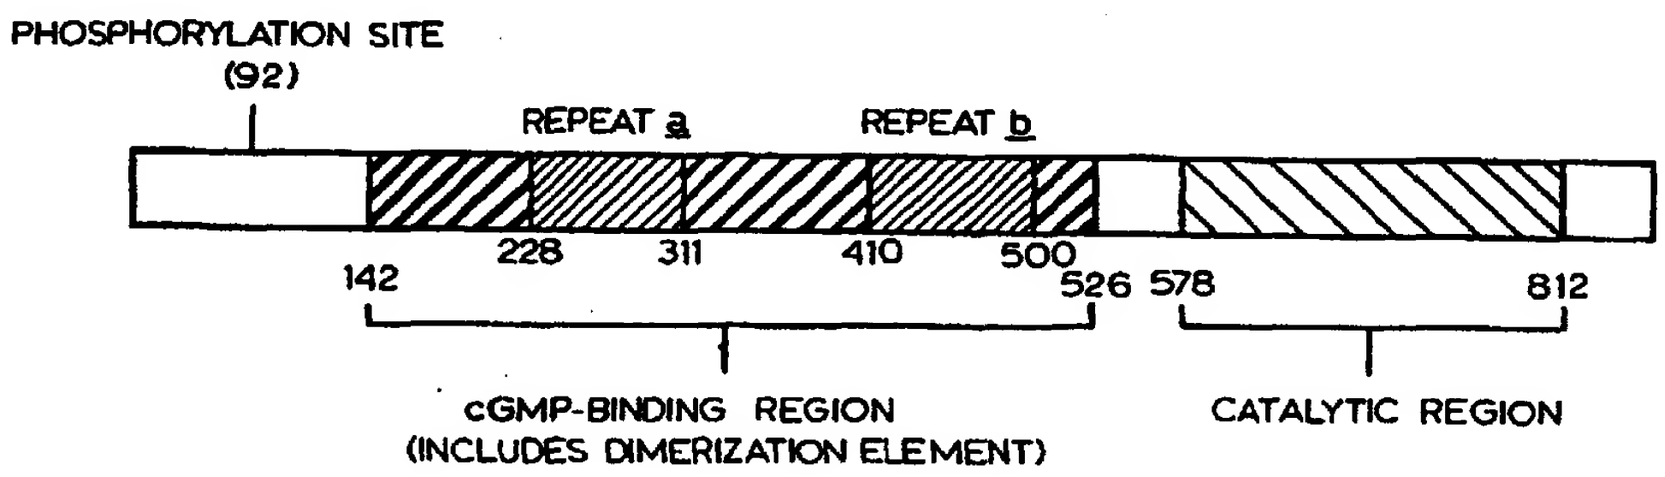
(54) Title: CYCLIC GMP-BINDING, CYCLIC GMP-SPECIFIC PHOSPHODIESTERASE MATERIALS AND METHODS



(57) Abstract

The present invention provides novel purified and isolated nucleotide sequences encoding the cGMP-binding, cGMP-specific phosphodiesterase designated cGB-PDE. Also provided by the invention are methods and materials for the recombinant production of cGB-PDE polypeptide products and methods for identifying compounds which modulate the enzymatic activity of cGB-PDE polypeptides.

CYCLIC GMP-BINDING, CYCLIC GMP-SPECIFIC PHOSPHODIESTERASE MATERIALS AND METHODS

This application is a continuation-in-part of co-pending U.S. Patent Application Serial No. 08/068,051 filed May 27, 1993.

Experimental work described herein was supported in part by Research Grants GM15731, DK21723, DK40029 and GM41269 and the Medical Scientist Training Program Grant GM07347 awarded by the National Institutes of Health. The United States government has certain rights in the invention.

FIELD OF THE INVENTION

The present invention relates generally to a cyclic guanosine monophosphate-binding, cyclic guanosine monophosphate-specific phosphodiesterase designated cGB-PDE and more particularly to novel purified and isolated polynucleotides encoding cGB-PDE polypeptides, to methods and materials for recombinant production of cGB-PDE polypeptides, and to methods for identifying modulators of cGB-PDE activity.

BACKGROUND

Cyclic nucleotide phosphodiesterases (PDEs) that catalyze the hydrolysis of 3′5′ cyclic nucleotides such as cyclic guanosine monophosphate (cGMP) and cyclic adenosine monophosphate (cAMP) to the corresponding nucleoside 5′ monophosphates constitute a complex family of enzymes. By mediating the intracellular concentration of the cyclic nucleotides, the PDE isoenzymes function in signal transduction pathways involving cyclic nucleotide second messengers.

A variety of PDEs have been isolated from different tissue sources and many of the PDEs characterized to date exhibit differences in biological properties including physicochemical properties, substrate specificity, sensitivity to inhibitors, immunological reactivity and mode of regulation. [See Beavo *et al., Cyclic Nucleotide Phosphodiesterases: Structure, Regulation and Drug Action*, John Wiley & Sons, Chichester, U.K. (1990)] Comparison of the known amino acid sequences of various PDEs indicates that most PDEs are chimeric multidomain proteins that

have distinct catalytic and regulatory domains. [See Charbonneau, pp. 267-296 in Beavo *et al., supra*] All mammalian PDEs characterized to date share a sequence of approximately 250 amino acid residues in length that appears to comprise the catalytic site and is located in the carboxyl terminal region of the enzyme. PDE domains that interact with allosteric or regulatory molecules are thought to be located within the amino-terminal regions of the isoenzymes. Based on their biological properties, the PDEs may be classified into six general families: the Ca^{2+}/calmodulin-stimulated PDEs (Type I), the cGMP-stimulated PDEs (Type II), the cGMP-inhibited PDEs (Type III), the cAMP-specfic PDEs (Type IV), the cGMP-specific phosphodiesterase cGB-PDE (Type V) which is the subject of the present invention and the cGMP-specific photoreceptor PDEs (Type VI).

The cGMP-binding PDEs (Type II, Type V and Type VI PDEs), in addition to having a homologous catalytic domain near their carboxyl terminus, have a second conserved sequence which is located closer to their amino terminus and which may comprise an allosteric cGMP-binding domain. See Charbonneau *et al., Proc. Natl. Acad. Sci. USA, 87*: 288-292 (1990).

The Type II cGMP-stimulated PDEs (cGs-PDEs) are widely distributed in different tissue types and are thought to exist as homodimers of 100-105 kDa subunits. The cGs-PDEs respond under physiological conditions to elevated cGMP concentrations by increasing the rate of cAMP hydrolysis. The amino acid sequence of a bovine heart cGs-PDE and a partial cDNA sequence of a bovine adrenal cortex cGS-PDE are reported in LeTrong *et al., Biochemistry, 29*: 10280-10288 (1990) and full length bovine adrenal and human fetal brain cGB-PDE cDNA sequences are described in Patent Cooperation Treaty International Publication No. WO 92/18541 published on October 29, 1992. The full length bovine adrenal cDNA sequence is also described in Sonnenburg *et al., J. Biol. Chem., 266*: 17655-17661 (1991).

The photoreceptor PDEs and the cGB-PDE have been described as cGMP-specific PDEs because they exhibit a 50-fold or greater selectivity for hydrolyzing cGMP over cAMP.

The photoreceptor PDEs are the rod outer segment PDE (ROS-PDE) and the cone PDE (COS-PDE). The holoenzyme structure of the ROS-PDE consists of two large subunits α (88 kDa) and β (84 kDa) which are both catalytically active

and two smaller γ regulatory subunits (both 11 kDa). A soluble form of the ROS-PDE has also been identified which includes α, β, and γ subunits and a δ subunit (15 kDa) that appears to be identical to the COS-PDE 15 kDa subunit. A full-length cDNA corresponding to the bovine membrane-associated ROS-PDE α subunit is described in Ovchinnikov *et al.*, *FEBS Lett.*, *223*: 169-173 (1987) and a full length cDNA corresponding to the bovine rod outer segment PDE β subunit is described in Lipkin *et al.*, *J. Biol. Chem.*, *265:* 12955-12959 (1990). Ovchinnikov *et al.*, *FEBS Lett.*, *204*: 169-173 (1986) presents a full-length cDNA corresponding to the bovine ROS-PDE γ subunit and the amino acid sequence of the δ subunit. Expression of the ROS-PDE has also been reported in brain in Collins *et al.*, *Genomics*, *13*: 698-704 (1992). The COS-PDE is composed of two identical α' (94 kDa) subunits and three smaller subunits of 11 kDa, 13 kDa and 15 kDa. A full-length cDNA corresponding to the bovine COS-PDE α' subunit is reported in Li *et al.*, *Proc. Natl. Acad. Sci. USA*, *87*: 293-297 (1990).

cGB-PDE has been purified to homogeneity from rat [Francis *et al.*, *Methods Enzymol.*, *159:* 722-729 (1988)] and bovine lung tissue [Thomas *et al.*, *J. Biol. Chem.*, *265*: 14964-14970 (1990), hereinafter "Thomas I"]. The presence of this or similar enzymes has been reported in a variety of tissues and species including rat and human platelets [Hamet *et al.*, *Adv. Cyclic Nucleotide Protein Phosphorylation Res.*, *16*: 119-136 (1984)], rat spleen [Coquil *et al.*, *Biochem. Biophys. Res. Commun.*, *127*: 226-231 (1985)], guinea pig lung [Davis *et al.*, *J. Biol. Chem.*, *252*: 4078-4084 (1977)], vascular smooth muscle [Coquil *et al.*, *Biochim. Biophys. Acta*, *631*: 148-165 (1980)], and sea urchin sperm [Francis *et al.*, *J. Biol. Chem.*, *255*: 620-626 (1979)]. cGB-PDE may be a homodimer comprised of two 93 kDa subunits. [See Thomas I, *supra*] cGB-PDE has been shown to contain a single site not found in other known cGMP-binding PDEs which is phosphorylated by cGMP-dependent protein kinase (cGK) and, with a lower affinity, by cAMP-dependent protein kinase (cAK). [See Thomas *et al.*, *J. Biol. Chem.*, *265*: 14971-14978 (1990), hereinafter "Thomas II"] The primary amino acid sequence of the phosphorylation site and of the amino-terminal end of a fragment generated by chymotryptic digestion of cGB-PDE are described in Thomas II, *supra*, and Thomas

I, *supra*, respectively. However, the majority of the amino acid sequence of cGB-PDE has not previously been described.

Various inhibitors of different types of PDEs have been described in the literature. Two inhibitors that exhibit some specificity for Type V PDEs are zaprinast and dipyridamole. See Francis *et al.*, pp. 117-140 in Beavo *et al.*, *supra*.

Elucidation of the DNA and amino acid sequences encoding the cGB-PDE and production of cGB-PDE polypeptide by recombinant methods would provide information and material to allow the identification of novel agents that selectively modulate the activity of the cGB-PDEs. The recognition that there are distinct types or families of PDE isoenzymes and that different tissues express different complements of PDEs has led to an interest in the development of PDE modulators which may have therapeutic indications for disease states that involve signal transduction pathways utilizing cyclic nucleotides as second messengers. Various selective and non-selective inhibitors of PDE activity are discussed in Murray *et al.*, *Biochem. Soc. Trans., 20(2)*: 460-464 (1992). Development of PDE modulators without the ability to produce a specific PDE by recombinant DNA techniques is difficult because all PDEs catalyze the same basic reaction, have overlapping substrate specificities and occur only in trace amounts. As a result, purification to homogeneity of many PDEs is a tedious and difficult process.

There thus continues to exist a need in the art for DNA and amino acid sequence information for the cGB-PDE, for methods and materials for the recombinant production of cGB-PDE polypeptides and for methods for identifying specific modulators of cGB-PDE activity.

SUMMARY OF THE INVENTION

The present invention provides novel purified and isolated polynucleotides (e.g., DNA sequences and RNA transcripts, both sense and antisense strands, including splice variants thereof) encoding the cGMP-binding, cGMP-specific PDE designated cGB-PDE. Preferred DNA sequences of the invention include genomic and cDNA sequences as well as wholly or partially chemically synthesized DNA sequences. DNA sequences encoding cGB-PDE that are set out in SEQ ID NO: 9 or 20 and DNA sequences which hybridize thereto under stringent conditions

or DNA sequences which would hybridize thereto but for the redundancy of the genetic code are contemplated by the invention. Also contemplated by the invention are biological replicas (i.e., copies of isolated DNA sequences made *in vivo* or *in vitro*) of DNA sequences of the invention. Autonomously replicating recombinant constructions such as plasmid and viral DNA vectors incorporating cGB-PDE sequences and especially vectors wherein DNA encoding cGB-PDE is operatively linked to an endogenous or exogenous expression control DNA sequence and a transcriptional terminator are also provided. Specifically illustrating expression plasmids of the invention is the plasmid hcgbmet156-2 6n in *E. coli* strain JM109 which was deposited with the American Type Culture Collection (ATCC), 12301 Parklawn Drive, Rockville, Maryland 20852, on May 4, 1993 as Accession No. 69296.

According to another aspect of the invention, host cells including procaryotic and eucaryotic cells, are stably transformed with DNA sequences of the invention in a manner allowing the desired polypeptides to be expressed therein. Host cells expressing cGB-PDE products can serve a variety of useful purposes. Such cells constitute a valuable source of immunogen for the development of antibody substances specifically immunoreactive with cGB-PDE. Host cells of the invention are conspicuously useful in methods for the large scale production of cGB-PDE polypeptides wherein the cells are grown in a suitable culture medium and the desired polypeptide products are isolated from the cells or from the medium in which the cells are grown by, for example, immunoaffinity purification.

cGB-PDE products may be obtained as isolates from natural cell sources or may be chemically synthesized, but are preferably produced by recombinant procedures involving host cells of the invention. Use of mammalian host cells is expected to provide for such post-translational modifications (e.g., glycosylation, truncation, lipidation and tyrosine, serine or threonine phosphorylation) as may be needed to confer optimal biological activity on recombinant expression products of the invention. cGB-PDE products of the invention may be full length polypeptides, fragments or variants. Variants may comprise cGB-PDE polypeptide analogs wherein one or more of the specified (i.e., naturally encoded) amino acids is deleted or replaced or wherein one or more nonspecified amino acids are added:

(1) without loss of one or more of the biological activities or immunological characteristics specific for cGB-PDE; or (2) with specific disablement of a particular biological activity of cGB-PDE.

Also comprehended by the present invention are antibody substances (e.g., monoclonal and polyclonal antibodies, single chain antibodies, chimeric antibodies, CDR-grafted antibodies and the like) and other binding proteins specific for cGB-PDE. Specific binding proteins can be developed using isolated or recombinant cGB-PDE or cGB-PDE variants or cells expressing such products. Binding proteins are useful, in turn, in compositions for immunization as well as for purifying cGB-PDE polypeptides and detection or quantification of cGB-PDE polypeptides in fluid and tissue samples by known immunogical procedures. They are also manifestly useful in modulating (i.e., blocking, inhibiting or stimulating) biochemical activities of cGB-PDE, especially those activities involved in signal transduction. Anti-idiotypic antibodies specific for anti-cGB-PDE antibody substances are also contemplated.

The scientific value of the information contributed through the disclosures of DNA and amino acid sequences of the present invention is manifest. As one series of examples, knowledge of the sequence of a cDNA for cGB-PDE makes possible the isolation by DNA/DNA hybridization of genomic DNA sequences encoding cGB-PDE and specifying cGB-PDE expression control regulatory sequences such as promoters, operators and the like. DNA/DNA hybridization procedures carried out with DNA sequences of the invention under stringent conditions are likewise expected to allow the isolation of DNAs encoding allelic variants of cGB-PDE, other structurally related proteins sharing one or more of the biochemical and/or immunological properties specific to cGB-PDE, and non-human species proteins homologous to cGB-PDE. Polynucleotides of the invention when suitably labelled are useful in hybridization assays to detect the capacity of cells to synthesize cGB-PDE. Polynucleotides of the invention may also be the basis for diagnostic methods useful for identifying a genetic alteration(s) in the cGB-PDE locus that underlies a disease state or states. Also made available by the invention are anti-sense polynucleotides relevant to regulating expression of cGB-PDE by those cells which ordinarily express the same.

The DNA and amino acid sequence information provided by the present invention also makes possible the systematic analysis of the structure and function of cGB-PDE and definition of those molecules with which it will interact. Agents that modulate cGB-PDE activity may be identified by incubating a putative modulator with lysate from eucaryotic cells expressing recombinant cGB-PDE and determining the effect of the putative modulator on cGB-PDE phosphodiesterase activity. In a preferred embodiment the eucaryotic cell lacks endogenous cyclic nucleotide phosphodiesterase activity. Specifically illustrating such a eucaryotic cell is the yeast strain YKS45 which was deposited with the ATCC on May 19, 1993 as Accession No. 74225. The selectivity of a compound that modulates the activity of the cGB-PDE can be evaluated by comparing its activity on the cGB-PDE to its activity on other PDE isozymes. The combination of the recombinant cGB-PDE products of the invention with other recombinant PDE products in a series of independent assays provides a system for developing selective modulators of cGB-PDE.

Selective modulators may include, for example, antibodies and other proteins or peptides which specifically bind to the cGB-PDE or cGB-PDE nucleic acid, oligonucleotides which specifically bind to the cGB-PDE or cGB-PDE nucleic acid and other non-peptide compounds (e.g., isloated or synthetic organic molecules) which specifically react with cGB-PDE or cGB-PDE nucleic acid. Mutant forms of cGB-PDE which affect the enzymatic activity or cellular localization of the wild-type cGB-PDE are also contemplated by the invention. Presently preferred targets for the development of selective modulators include, for example: (1) the regions of the cGB-PDE which contact other proteins and/or localize the cGB-PDE within a cell, (2) the regions of the cGB-PDE which bind substrate, (3) the allosteric cGMP-binding site(s) of cGB-PDE, (4) the phosphorylation site(s) of cGB-PDE and (5) the regions of the cGB-PDE which are involved in dimerization of cGB-PDE subunits. Modulators of cGB-PDE activity may be therapeutically useful in treatment of a wide range of diseases and physiological conditions.

BRIEF DESCRIPTION OF THE DRAWINGS

Numerous other aspects and advantages of the present invention will be apparent upon consideration of the following detailed description thereof, reference being made to the drawing wherein:

FIGURE 1A to 1C is an alignment of the conserved catalytic domains of several PDE isoenzymes wherein residues which are identical in all PDEs listed are indicated by their one letter amino acid abbreviation in the "conserved" line, residues which are identical in the cGB-PDE and photoreceptor PDEs only are indicated by a star in the "conserved" line and gaps introduced for optimum alignment are indicated by periods;

FIGURE 2A to 2C is an alignment of the cGMP-binding domains of several PDE isoenzymes wherein residues which are identical in all PDEs listed are indicated by their one letter amino acid abbreviation in the "conserved" line and gaps introduced for optimum alignment are indicated by periods;

FIGURE 3 is an alignment of internally homologous repeats from several PDE isoenzymes wherein residues identical in each repeat A and B from all cGMP-binding PDEs listed are indicated by their one letter amino acid abbreviation in the "conserved" line and stars in the "conserved" line represent positions in which all residues are chemically conserved;

FIGURE 4 schematically depicts the domain organization of cGB-PDE;

FIGURE 5 is a bar graph representing the results of experiments in which extracts of COS cells transfected with bovine cGB-PDE sequences or extracts of untransfected COS cells were assayed for phosphodiesterase activity using either 20 μM cGMP or 20 μM cAMP as the substrate;

FIGURE 6 is a graph depicting results of assays of extracts from cells transfected with bovine cGB-PDE sequences for cGMP phosphodiesterase activity in the presence of a series of concentrations of phosphodiesterase inhibitors including dypyridamole (closed squares), zaprinast (closed circles), methoxymethylxanthine (closed triangles) and rolipram (open circles);

FIGURE 7 is a bar graph presenting results of experiments in which cell extracts from COS cells transfected with bovine cGB-PDE sequences or control

untransfected COS cells were assayed for [^{3}H]cGMP-binding activity in the absence (-) or presence (+) of 0.2 mM IBMX; and

FIGURE 8 is a graph of the results of assays in which extracts from cells transfected with bovine cGB-PDE sequences were assayed for [^{3}H]cGMP-binding activity in the presence of excess unlabelled cAMP (open circles) or cGMP (closed circles) at the concentrations indicated.

DETAILED DESCRIPTION

The following examples illustrate the invention. Example 1 describes the isolation of a bovine cGB-PDE cDNA fragment by PCR and subsequent isolation of a full length cGB-PDE cDNA using the PCR fragment as a probe. Example 2 presents an analysis of the relationship of the bovine cGB-PDE amino acid sequence to sequences reported for various other PDEs. Northern blot analysis of cGB-PDE mRNA in various bovine tissues is presented in Example 3. Expression of the bovine cGB-PDE cDNA in COS cells is described in Example 4. Example 5 presents results of assays of the cGB-PDE COS cell expression product for phosphodiesterase activity, cGMP-binding activity and Zn^{2+} hydrolase activity. Example 6 describes the isolation of human cDNAs homologous to the bovine cGB-PDE cDNA. The expression of a human cGB-PDE cDNA in yeast cells is presented in Example 7. RNase protection assays to detect cGB-PDE in human tissues are described in Example 8. Example 9 describes the bacterial expression of human cGB-PDE cDNA and the development of antibodies reactive with the bacterial cGB-PDE expression product. Example 10 describes cGB-PDE analogs and fragments. The generation of monoclonal antibodies that recognize cGB-PDE is described in Example 11. Example 12 relates to utlilizing recombinant cGB-PDE products of the invention to develop agents that selectively modulate the biological activities of cGB-PDE.

Example 1

The polymerase chain reaction (PCR) was utilized to isolate a cDNA fragment encoding a portion of cGB-PDE from bovine lung first strand cDNA. Fully degenerate sense and antisense PCR primers were designed based on the partial cGB-

PDE amino acid sequence described in Thomas I, *supra*, and novel partial amino acid sequence information.

A. Purification of cGB-PDE Protein

cGB-PDE was purified as described in Thomas I, *supra*, or by a modification of that method as described below.

Fresh bovine lungs (5-10 kg) were obtained from a slaughterhouse and immediately placed on ice. The tissue was ground and combined with cold PEM buffer (20mM sodium phosphate, pH 6.8, containing 2mM EDTA and 25mM β-mercaptoethanol). After homogenization and centrifugation, the resulting supernatant was incubated with 4-7 liters of DEAE-cellulose (Whatman, UK) for 3-4 hours. The DEAE slurry was then filtered under vacuum and rinsed with multiple volumes of cold PEM. The resin was poured into a glass column and washed with three to four volumes of PEM. The protein was eluted with 100mM NaCl in PEM and twelve 1-liter fractions were collected. Fractions were assayed for IBMX-stimulated cGMP binding and cGMP phosphodiesterase activities by standard procedures described in Thomas *et al.*, *supra*. Appropriate fractions were pooled, diluted 2-fold with cold, deionized water and subjected to Blue Sepharose® CL-6B (Pharmacia LKB Biotechnology Inc., Piscataway, NJ) chromatography. Zinc chelate affinity adsorbent chromatography was then performed using either an agarose or Sepharose-based gel matrix. The resulting protein pool from the zinc chelation step treated as described in the Thomas I, *supra*, or was subjected to a modified purification procedure.

As decribed in Thomas I, *supra*, the protein pool was applied in multiple loads to an HPLC Bio-Sil TSK-545 DEAE column (150 x 21.5 mm) (BioRad Laboratories, Hercules, CA) equilibrated in PEM at 4˚C. After an equilibration period, a 120-ml wash of 50mM NaCl in PEM was followed by a 120-ml linear gradient (50-200mM NaCl in PEM) elution at a flow rate of 2 ml/minute. Appropriate fractions were pooled and concentrated in dialysis tubing against Sephadex G-200 (Boehringer Mannheim Biochemicals, UK) to a final volume of 1.5 ml. The concentrated cGB-PDE pool was applied to an HPLC gel filtration column (Bio-Sil TSK-250, 500 x 21.5 mm) equilibrated in 100mM sodium phosphate, pH 6.8, 2mM EDTA, 25mM β-mercaptoethanol and eluted with a flow rate of 2 ml/minute at 4˚C.

If the modified, less cumbersome procedure was performed, the protein pool was dialyzed against PEM for 2 hours and loaded onto a 10 ml preparative DEAE Sephacel column (Pharmacia) equilibrated in PEM buffer. The protein was eluted batchwise with 0.5M NaCl in PEM, resulting in an approximately 10-15 fold concentration of protein. The concentrated protein sample was loaded onto an 800 ml (2.5 cm x 154 cm) Sephacryl S400 gel filtration column (Boehringer) equilibrated in 0.1M NaCl in PEM, and eluted at a flow rate of 1.7 ml/minute.

The purity of the protein was assessed by Coomassie staining after sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE). Approximately 0.5-3.0 mg of pure cGB-PDE were obtained per 10 kg bovine lung.

Rabbit polyclonal antibodies specific for the purified bovine cGB-PDE were generated by standard procedures.

B. Amino Acid Sequencing of cGB-PDE

cGB-PDE phosphorylated with [^{32}P]ATP and was then digested with protease to yield ^{32}P-labelled phosphopeptides. Approximately 100 μg of purified cGB-PDE was phosphorylated in a reaction mixture containing 9mM $MgCl_2$, 9μM [^{32}P]ATP, 10μM cGMP, and 4.2 μg purified bovine catalytic subunit of cAMP-dependent protein kinase (cAK) in a final volume of 900 μl. Catalytic subunit of cAK was prepared according to the method of Flockhart *et al.*, pp. 209-215 in Marangos et al., *Brain Receptor Methodologies, Part A*, Academic Press, Orlando, Florida (1984). The reaction was incubated for 30 minutes at 30°C, and stopped by addition of 60 μl of 200mM EDTA.

To obtain a first peptide sequence from cGB-PDE, 3.7 μl of a 1 mg/ml solution of a α-chymotrypsin in KPE buffer (10mM potassium phosphate, pH 6.8, with 2mM EDTA) was added to 100 μg purified, phosphorylated cGB-PDE and the mixture was incubated for 30 minutes at 30°C. Proteolysis was stopped by addition of 50 μl of 10% SDS and 25 μl of β-mercaptoethanol. The sample was boiled until the volume was reduced to less than 400 μl, and was loaded onto an 8% preparative SDS-polyacrylamide gel and subjected to electrophoresis at 50mAmps. The separated digestion products were electroblotted onto Immobilon polyvinylidene difluoride (Millipore, Bedford, MA), according to the method of Matsudaira, *J. Biol. Chem*, *262*: 10035-10038 (1987). Transferred protein was identified by Coomassie Blue

staining, and a 50 kDa band was excised from the membrane for automated gas-phase amino acid sequencing. The sequence of the peptide obtained by the α-chymotryptic digestion procedure is set out below as SEQ ID NO: 1.

SEQ ID NO: 1

REXDANRINYMYAQYVKNTM

A second sequence was obtained from a cGB-PDE peptide fragment generated by V8 proteolysis. Approximately 200 μg of purified cGB-PDE was added to 10mM $MgCl_2$, 10μM [^{32}P]ATP, 100μM cGMP, and 1 μg/ml purified catalytic subunit of cAK in a final volume of 1.4 ml. The reaction was incubated for 30 minutes at 30°C, and was terminated by the addition of 160 μl of 0.2M EDTA. Next, 9 μl of 1 mg/ml *Staphylococcal aureus* V8 protease (International Chemical Nuclear Biomedicals, Costa Mesa, CA) diluted in KPE was added, followed by a 15 minute incubation at 30°C. Proteolysis was stopped by addition of 88 μl of 10% SDS and 45 μl β-mercaptoethanol. The digestion products were separated by electrophoresis on a preparative 10% SDS-polyacrylamide gel run at 25 mAmps for 4.5 hours. Proteins were electroblotted and stained as described above. A 28 kDa protein band was excised from the membrane and subjected to automated gas-phase amino acid sequencing. The sequence obtained is set out below as SEQ ID NO: 2.

SEQ ID NO: 2

QSLAAAVVP

C. PCR Amplification of Bovine cDNA

The partial amino acid sequences utilized to design primers (SEQ ID NO: 3, below, and amino acids 9-20 of SEQ ID NO: 1) and the sequences of the corresponding PCR primers (in IUPAC nomenclature) are set below wherein SEQ ID NO: 3 is the sequence reported in Thomas I, *supra*.

SEQ ID NO: 3

The sense and antisense primers, synthesized using an Applied Biosystems Model 380A DNA Synthesizer (Foster City, CA), were used in all possible combinations to amplify cGB-PDE-specific sequences from bovine lung first strand cDNA as described below.

After ethanol precipitation, pairs of oligonucleotides were combined (SEQ ID NO: 4 or 5 combined with SEQ ID NOs: 6, 7 or 8) at 400nM each in a PCR reaction. The reaction was run using 50 ng first strand bovine lung cDNA (generated using AMV reverse transcriptase and random primers on oligo dT selected bovine lung mRNA), 200μM dNTPs, and 2 units of Taq polymerase. The initial denaturation step was carried out at 94°C for 5 minutes, followed by 30 cycles of a 1 minute denaturation step at 94°C, a two minute annealing step at 50°C, and a 2 minute extension step at 72°C. PCR was performed using a Hybaid Thermal Reactor (ENK Scientific Products, Saratoga, CA) and products were separated by gel electrophoresis on a 1% low melting point agarose gel run in 40mM Tris-acetate, 2mM EDTA. A weak band of about 800-840 bp was seen with the primers set out in SEQ ID NOs: 4 and 7 and with primers set out in SEQ ID NOs: 4 and 8. None of the other primer pairs yielded visible bands. The PCR product generated by amplification with the primers set out in SEQ ID NOs: 4 and 7 was isolated using the Gene Clean® (Bio101, La Jolla, CA) DNA purification kit according to the manufacturer's protocol. The PCR product (20 ng) was ligated into 200 ng of linearized pBluescript KS(+) (Stratagene, La Jolla, CA), and the resulting plasmid construct was used to transform *E. coli* XL1 Blue cells (Stratagene Cloning Systems, La Jolla, CA). Putative transformation positives were screened by sequencing. The sequences obtained were not homologous to any known PDE sequence or to the known partial cGB-PDE sequences.

PCR was performed again on bovine lung first strand cDNA using the primers set out in SEQ ID NOs: 4 and 7. A clone containing a 0.8 Kb insert with a single large open reading frame was identified. The open reading frame encoded a polypeptide that included the amino acids KNTM (amino acids 17-20 of SEQ ID NO: 1 which were not utilized to design the primer sequence which is set out in SEQ ID NO: 7) and that possessed a high degree of homology to the deduced amino acid sequences of the cGs-, ROS- and COS-PDEs. The clone identified corresponds to nucleotides 489-1312 of SEQ ID NO: 9.

D. Construction and Hybridization Screening of a Bovine cDNA Library

In order to obtain a cDNA encoding a full-length cGB-PDE, a bovine lung cDNA library was screened using the ^{32}P-labelled PCR-generated cDNA insert as a probe.

Polyadenylated RNA was prepared from bovine lung as described Sonnenburg et al., *J. Biol. Chem.*, *266*: 17655-17661 (1991). First strand cDNA was synthesized using AMV reverse transcriptase (Life Sciences, St. Petersburg, FL) with random hexanucleotide primers as described in Ausubel et al., ***Current Protocols in Molecular Biology***, John Wiley & Sons, New York (1987). Second strand cDNA was synthesized using *E. coli* DNA polymerase I in the presence of *E. coli* DNA ligase and *E. coli* RNAse H. Selection of cDNAs larger than 500 bp was performed by Sepharose® CL-4B (Millipore) chromatography. *Eco*RI adaptors (Promega, Madison, WI) were ligated to the cDNA using T4 DNA ligase. Following heat inactivation of the ligase, the cDNA was phosphorylated using T4 polynucleotide kinase. Unligated adaptors were removed by Sepharose® CL-4B chromatography (Pharmacia, Piscataway, NJ). The cDNA was ligated into *Eco*RI-digested, dephosphorylated lambda Zap®II arms (Stratagene) and packaged with Gigapack® Gold (Stratagene) extracts according to the manufacturer's protocol. The titer of the unamplified library was 9.9×10^5 with 18% nonrecombinants. The library was amplified by plating 50,000 plaque forming units (pfu) on to twenty 150 mm plates, resulting in a final titer of 5.95×10^6 pfu/ml with 21% nonrecombinants.

The library was plated on twenty-four 150 mm plates at 50,000 pfu/plate, and screened with the ^{32}P-labelled cDNA clone. The probe was prepared

using the method of Feinberg *et al.*, *Anal. Biochem.*, *137*: 266-267 (1984), and the ^{32}P-labelled DNA was purified using Elutip-D® columns (Schleicher and Schuell Inc., Keene, NH) using the manufacturer's protocol. Plaque-lifts were performed using 15 cm nitrocellulose filters. Following denaturation and neutralization, DNA was fixed onto the filters by baking at 80°C for 2 hours. Hybridization was carried out at 42°C overnight in a solution containing 50% formamide, 5X SSC (0.75M NaCl, 0.75M sodium citrate, pH 7), 25mM sodium phosphate (pH 7.0), 2X Denhardt's solution, 10% dextran sulfate, 90 μg/ml yeast tRNA, and approximately 10^6 cpm/ml ^{32}P-labelled probe ($5x10^8$ cpm/μg). The filters were washed twice in 0.1X SSC, 0.1% SDS at room temperature for 15 minutes per wash, followed by a single 20 minute wash in 0.1X SSC, 1% SDS at 45°C. The filters were then exposed to X-ray film at -70°C for several days.

Plaques that hybridized with the labelled probe were purified by several rounds of replating and rescreening. Insert cDNAs were subcloned into the pBluescript SK(-) vector (Stratagene) by the *in vivo* excision method described by the manufacturer's protocol. Southern blots were performed in order to verify that the rescued cDNA hybridized to the PCR probe. Putative cGB-PDE cDNAs were sequenced using Sequenase® Version 2.0 (United States Biochemical Corporation, Cleveland, Ohio) or TaqTrack® kits (Promega).

Three distinct cDNA clones designated cGB-2, cGB-8 and cGB-10 were isolated. The DNA and deduced amino acid sequences of clone cGB-8 are set out in SEQ ID NOs: 9 and 10. The DNA sequence downstream of nucleotide 2686 may represent a cloning artifact. The DNA sequence of cGB-10 is identical to the sequence of cGB-8 with the exception of one nucleotide. The DNA sequence of clone cGB-2 diverges from that of clone cGB-8 5′ to nucleotide 219 of clone cgb-8 (see SEQ ID NO: 9) and could encode a protein with a different amino terminus.

The cGB-8 cDNA clone is 4474 bp in length and contains a large open reading frame of 2625 bp. The triplet ATG at position 99-101 in the nucleotide sequence is predicted to be the translation initiation site of the cGB-PDE gene because it is preceded by an in-frame stop codon and the surrounding bases are compatible with the Kozak consensus initiation site for eucaryotic mRNAs. The stop codon TAG is located at positions 2724-2726, and is followed by 1748 bp of 3′ untranslated

sequence. The sequence of cGB-8 does not contain a transcription termination consensus sequence, therefore the clone may not represent the entire 3′ untranslated region of the corresponding mRNA.

The open reading frame of the cGB-8 cDNA encodes an 875 amino acid polypeptide with a calculated molecular mass of 99.5 kD. This calculated molecular mass is only slightly larger than the reported molecular mass of purified cGB-PDE, estimated by SDS-PAGE analysis to be approximately 93 kDa. The deduced amino acid sequence of cGB-8 corresponded exactly to all peptide sequences obtained from purified bovine lung cGB-PDE providing strong evidence that cGB-8 encodes cGB-PDE.

Example 2

A search of the SWISS-PROT and GEnEmbl data banks (Release of February, 1992) conducted using the FASTA program supplied with the Genetics Computer Group (GCG) Software Package (Madison, Wisconsin) revealed that only DNA and amino acid sequences reported for other PDEs displayed significant similarity to the DNA and deduced amino acid of clone cGB-8.

Pairwise comparisons of the cGB-PDE deduced amino acid sequence with the sequences of eight other PDEs were conducted using the ALIGN [Dayhoff *et al., Methods Enzymol., 92*: 524-545 (1983)] and BESTFIT [Wilbur *et al., Proc. Natl. Acad. Sci. USA, 80*: 726-730 (1983)] programs. Like all mammalian phosphodiesterases sequenced to date, cGB-PDE contains a conserved catalytic domain sequence of approximately 250 amino acids in the carboxyl-terminal half of the protein that is thought to be essential for catalytic activity. This segment comprises amino acids 578-812 of SEQ ID NO: 9 and exhibits sequence conservation with the corresponding regions of other PDEs. Table 1 below sets out the specific identity values obtained in pairwise comparisons of other PDEs with amino acids 578-812 of cGB-PDE, wherein "ratdunce" is the rat cAMP-specific PDE; "61 kCaM" is the bovine 61 kDa calcium/calmodulin-dependent PDE; "63 kCaM" is the bovine 63 kDa calcium/calmodulin-dependent PDE; "drosdunce" is the drosophila cAMP-specific dunce PDE; "ROS-α" is the bovine ROS-PDE α-subunit; "ROS-β" is the

bovine ROS-PDE β-subunit; "COS-α'" is the bovine COS-PDE α' subunit; and "cGs" is the bovine cGs-PDE (612-844).

Table 1

Phosphodiesterase	Catalytic Domain Residues	% Identity
Ratdunce	77-316	31
61 kCaM	193-422	29
63 kcam	195-424	29
drosdunce	1-239	28
ROS-α	535-778	45
ROS-β	533-776	46
COS-α'	533-776	48
cGs	612-844	40

Multiple sequence alignments were performed using the Progressive Alignment Algorithm [Feng *et al.*, *Methods Enzymol.*, *183*: 375-387 (1990)] implemented in the PILEUP program (GCG Software). FIGURE 1A to 1C shows a multiple sequence alignment of the proposed catalytic domain of cGB-PDE with the all the corresponding regions of the PDEs of Table 1. Twenty-eight residues (see residues indicated by one letter amino acid abbreviations in the "conserved" line on FIGURE 1A to 1C) are invariant among the isoenzymes including several conserved histidine residues predicted to play a functional role in catalysis. See Charbonneau *et al.*, *Proc. Natl. Acad. Sci. USA*, *supra*. The catalytic domain of cGB-PDE more closely resembles the catalytic domains of the ROS-PDEs and COS-PDEs than the corresponding regions of other PDE isoenzymes. There are several conserved regions among the photoreceptor PDEs and cGB-PDE that are not shared by other PDEs. Amino acid positions in these regions that are invariant in the photoreceptor PDE and cGB-PDE sequences are indicated by stars in the "conserved" line of FIGURE 1A to 1C. Regions of homology among cGB-PDE and the ROS- and COS-PDEs may serve important roles in conferring specificity for cGMP hydrolysis relative to cAMP hydrolysis or for sensitivity to specific pharmacological agents.

Sequence similarity between cGB-PDE, cGs-PDE and the photoreceptor PDEs, is not limited to the conserved catalytic domain but also includes the noncatalytic cGMP binding domain in the amino-terminal half of the protein. Optimization of the alignment between cGB-PDE, cGs-PDE and the photoreceptor PDEs indicates that an amino-terminal conserved segment may exist including amino acids 142-526 of SEQ ID NO: 9. Pairwise analysis of the sequence of the proposed cGMP-binding domain of cGB-PDE with the corresponding regions of the photoreceptor PDEs and cGs-PDE revealed 26-28% sequence identity. Multiple sequence alignment of the proposed cGMP-binding domains with the cGMP-binding PDEs is shown in FIGURE 2A to 2C wherein abbreviations are the same as indicated for Table 1. Thirty-eight positions in this non-catalytic domain appear to be invariant among all cGMP-binding PDEs (see positions indicated by one letter amino acid abbreviations in the "conserved" line of FIGURE 2A to 2C).

The cGMP-binding domain of the cGMP-binding PDEs contains internally homologous repeats which may form two similar but distinct inter- or intra-subunit cGMP-binding sites. FIGURE 3 shows a multiple sequence alignment of the repeats a (corresponding to amino acids 228-311 of cGB-PDE) and b (corresponding to amino acids 410-500 of cGB-PDE) of the cGMP-binding PDEs. Seven residues are invariant in each A and B regions (see residues indicated by one letter amino acid abbreviations in the "conserved" line of FIGURE 3). Residues that are chemically conserved in the A and B regions are indicated by stars in the "conserved" line of FIGURE 3. cGMP analog studies of cGB-PDE support the existence of a hydrogen bond between the cyclic nucleotide binding site on cGB-PDE and the 2'OH of cGMP.

Three regions of cGB-PDE have no significant sequence similarity to other PDE isoenzymes. These regions include the sequence flanking the carboxyl-terminal end of the catalytic domain (amino acids 812-875), the sequence separating the cGMP-binding and catalytic domains (amino acids 527-577) and the amino-terminal sequence spanning amino acids 1-141. The site (the serine at position 92 of SEQ ID NO: 10) of phosphorylation of cGB-PDE by cGK is located in this amino-terminal region of sequence. Binding of cGMP to the allosteric site on cGB-PDE is required for its phosphorylation.

A proposed domain structure of cGB-PDE based on the foregoing comparisons with other PDE isoenzymes is presented in FIGURE 4. This domain structure is supported by the biochemical studies of cGB-PDE purified from bovine lung.

Example 3

The presence of cGB-PDE mRNA in various bovine tissues was examined by Northern blot hybridization.

Polyadenylated RNA was purified from total RNA preparations using the Poly(A) Quick® mRNA purification kit (Stratagene) according to the manufacturer's protocol. RNA samples (5 μg) were loaded onto a 1.2% agarose, 6.7% formaldehyde gel. Electrophoresis and RNA transfer were performed as previously described in Sonnenburg *et al.*, *supra*. Prehybridization of the RNA blot was carried out for 4 hours at 45°C in a solution containing 50% formamide, 5X SSC, 25mM sodium phosphate, pH 7, 2X Denhardt's solution, 10% dextran sulfate, and 0.1 mg/ml yeast tRNA. A random hexanucleotide-primer-labelled probe (5 X 10^8 cpm/μg) was prepared as described in Feinberg *et al.*, *supra*, using the 4.7 kb cGB-8 cDNA clone of Example 2 excised by digestion with *Acc*I and *Sac*II. The probe was heat denatured and injected into a blotting bag (6 X 10^5 cpm/ml) following prehybridization. The Northern blot was hybridized overnight at 45°C, followed by one 15 minute wash with 2X SSC, 0.1% SDS at room temperature, and three 20 minute washes with 0.1X SSC, 0.1% SDS at 45°C. The blot was exposed to X-ray film for 24 hours at -70°C. The size of the RNA that hybridized with the cGB-PDE probe was estimated using a 0.24-9.5 kb RNA ladder that was stained with ethidium bromide and visualized with UV light.

The ^{32}P-labelled cGB-PDE cDNA hybridized to a single 6.8 kb bovine lung RNA species. A mRNA band of the identical size was also detected in polyadenylated RNA isolated from bovine trachea, aorta, kidney and spleen.

Example 4

The cGB-PDE cDNA in clone cGB-8 of Example 2 was expressed in COS-7 cells (ATCC CRL1651).

A portion of the cGB-8 cDNA was isolated following digestion with the restriction enzyme *XbaI*. *XbaI* cut at a position in the pBluescript polylinker sequence located 30 bp upstream of the 5′ end of the cGB-8 insert and at position 3359 within the cGB-8 insert. The resulting 3389 bp fragment, which contains the entire coding region of cGB-8, was then ligated into the unique *XbaI* cloning site of the expression vector pCDM8 (Invitrogen, San Diego, CA). The pCDM8 plasmid is a 4.5 kb eucaryotic expression vector containing a cytomegalovirus promoter and enhancer, an SV40-derived origin of replication, a polyadenylation signal, a procaryotic origin of replication (derived from pBR322) and a procaryotic genetic marker (supF). *E. coli* MC1061/P3 cells (Invitrogen) were transformed with the resulting ligation products, and transformation positive colonies were screened for proper orientation of the cGB-8 insert using PCR and restriction enzyme analysis. The resulting expression construct containing the cGB-8 insert in the proper orientation is referred to as pCDM8-cGB-PDE.

The pCDM8-cGB-PDE DNA was purified from large-scale plasmid preparations using Qiagen pack-500 columns (Chatsworth, CA) according to the manufacturer's protocol. COS-7 cells were cultured in Dulbecco's modified Eagle's medium (DMEM) containing 10% fetal bovine serum, 50 μg/ml penicillin and 50 μg/ml streptomycin at 37°C in a humidified 5% CO_2 atmosphere. Approximately 24 hours prior to transfection, confluent 100 mm dishes of cells were replated at one-fourth or one-fifth the original density. In a typical transfection experiment, cells were washed with buffer containing 137mM NaCl, 2.7mM KCl, 1.1mM potassium phosphate, and 8.1mM sodium phosphate, pH 7.2 (PBS). Then 4-5 ml of DMEM containing 10% NuSerum (Collaborative Biomedical Products, Bedford, MA) was added to each plate. Transfection with 10 μg pCDM8-cGB-PDE DNA or pCDM8 vector DNA mixed with 400 μg DEAE-dextran (Pharmacia) in 60 μl TBS [Tris-buffered saline: 25mM Tris-HCl (pH 7.4), 137mM NaCl, 5mM KCl, 0.6mM Na_2HPO_4, 0.7mM $CaCl_2$, and 0.5mM $MgCl_2$] was carried out by dropwise addition of the mixture to each plate. The cells were incubated at 37°C, 5% CO_2 for 4 hours, and then treated with 10% dimethyl sulfoxide in PBS for 1 minute. After 2 minutes, the dimethyl sulfoxide was removed, the cells were washed with PBS and incubated in complete medium. After 48 hours, cells were suspended in 0.5-1 ml of cold

homogenization buffer [40mM Tris-HCl (pH 7.5), 15mM benzamidine, 15mM β-mercaptoethanol, 0.7 μg/ml pepstatin A, 0.5 μg/ml leupeptin, and 5μM EDTA] per plate of cells, and disrupted using a Dounce homogenizer. The resulting whole-cell extracts were assayed for phosphodiesterase activity, cGMP-binding activity, and total protein concentration as described below in Example 5.

Example 5

Phosphodiesterase activity in extracts of the transfected COS cells of Example 4 or in extracts of mock transfected COS cells was measured using a modification of the assay procedure described for the cGs-PDE in Martins *et al., J. Biol. Chem., 257*: 1973-1979 (1982). Cells were harvested and extracts prepared 48 hours after transfection. Incubation mixtures contained 40mM MOPS buffer (pH 7), 0.8mM EDTA, 15mM magnesium acetate, 2 mg/ml bovine serum albumin, 20μM [^{3}H]cGMP or [^{3}H]cAMP (100,000-200,000 cpm/assay) and COS-7 cell extract in a total volume of 250 μl. The reaction mixture was incubated for 10 minutes at 30°C, and then stopped by boiling. Next, 10 μl of 10mg/ml *Crotalus atrox* venom (Sigma) was added followed by a 10 minute incubation at 30°C. Nucleoside products were separated from unreacted nucleotides as described in Martins *et al., supra.* In all studies, less than 15% of the total [^{3}H]cyclic nucleotide was hydrolyzed during the reaction.

The results of the assays are presented in FIGURE 5 wherein the results shown are averages of three separate transfections. Transfection of COS-7 cells with pCDM8-cGB-PDE DNA resulted in the expression of approximately 15-fold higher levels of cGMP phosphodiesterase activity than in mock-transfected cells or in cells transfected with pCDM8 vector alone. No increase in cAMP phosphodiesterase activity over mock or vector-only transfected cells was detected in extracts from cells transfected with pCDM8-cGB-PDE DNA. These results confirm that the cGB-PDE bovine cDNA encodes a cGMP-specific phosphodiesterase.

Extracts from the transfected COS cells of Example 4 were also assayed for cGMP PDE activity in the presence of a series of concentrations of the PDE inhibitors zaprinast, dipyridamole (Sigma), isobutyl-1-methyl-8-methoxymethylxanthine (MeOxMeMIX) and rolipram.

The results of the assays are presented in FIGURE 6 wherein PDE activity in the absence of inhibitor is taken as 100% and each data point represents the average of two separate determinations. The relative potencies of PDE inhibitors for inhibition of cGMP hydrolysis by the expressed cGB-BPDE cDNA protein product were identical to those relative potencies reported for native cGB-PDE purified from bovine lung (Thomas I, *supra*). IC_{50} values calculated from the curves in FIGURE 6 are as follows: zaprinast (closed circles), 2 μM; dipyridamole (closed squares), 3.5 μM; MeOxMeMIX (closed triangles), 30 μM; and rolipram (open circles), >300 μM. The IC_{50} value of zaprinast, a relatively specific inhibitor of cGMP-specific phosphodiesterases, was at least two orders of magnitude lower than that reported for inhibition of phosphodiesterase activity of the cGs-PDE or of the cGMP-inhibited phosphodiesterase (cGi-PDEs) (Reeves *et al.*, pp. 300-316 in Beavo *et al.*, *supra*). Dipyrimadole, an effective inhibitor of selected cAMP- and cGMP-specific phosphodiesterases, was also a potent inhibitor of the expressed cGB-PDE. The relatively selective inhibitor of calcium/calmodulin-stimulated phosphodiesterase (CaM-PDEs), MeOxMeMIX, was approximately 10-fold less potent than zaprinast and dipyridamole, in agreement with results using cGB-PDE activity purified from bovine lung. Rolipram, a potent inhibitor of low K_m cAMP phosphodisterases, was a poor inhibitor of expressed cGB-PDE cDNA protein product. These results show that the cGB-PDE cDNA encodes a phosphodiesterase that possesses catalytic activity characteristic of cGB-PDE isolated from bovine tissue, thus verifying the identity of the cGB-8 cDNA clone as a cGB-PDE.

It is of interest to note that although the relative potencies of the PDE inhibitors for inhibition of cGMP hydrolysis were identical for the recombinant and bovine isolate cGB-PDE, the absolute IC_{50} values for all inhibitors tested were 2-7 fold higher for the recombinant cGB-PDE. This difference could not be attributed to the effects of any factors present in COS-7 cell extracts on cGMP hydrolytic activity, since cGB-PDE isolated from bovine tissue exhibited identical kinetics of inhibition as a pure enzyme, or when added back to extracts of mock-transfected COS-7 cells. This apparent difference in pharmacological sensitivity may be due to a subtle difference in the structure of the recombinant cGB-PDE cDNA protein product and bovine lung cGB-PDE, such as a difference in post-translational

modification at or near the catalytic site. Alternatively, this difference may be due to an alteration of the catalytic activity of bovine lung cGB-PDE over several purification steps.

Cell extracts were assayed for [^{3}H]cGMP-binding activity in the absence or presence of 0.2mM 3-isobutyl-1-methylaxanthine (IBMX) (Sigma), a competitive inhibitor of cGMP hydrolysis. The cGMP binding assay, modified from the assay described in Thomas I, *supra*, was conducted in a total volume of 80 μl. Sixty μl of cell extract was combined with 20 μl of a binding cocktail such that the final concentration of components of the mixture were 1μM [^{3}H]cGMP, 5μM cAMP, and 10μM 8-bromo-cGMP. The cAMP and 8-bromo-cGMP were added to block [^{3}H]cGMP binding to cAK and cGK, respectively. Assays were carried out in the absence and presence of 0.2mM IBMX. The reaction was initiated by the addition of the cell extract, and was incubated for 60 minutes at 0°C. Filtration of the reaction mixtures was carried out as described in Thomas I, *supra*. Blanks were determined by parallel incubations with homogenization buffer replacing cell extracts, or with a 100-fold excess of unlabelled cGMP. Similar results were obtained with both methods. Total protein concentration of the cell extracts was determined by the method of Bradford, *Anal. Biochem.*, *72*:248-254 (1976) using bovine serum albumin as the standard.

Results of the assay are set out in FIGURE 7. When measured at 1μM [^{3}H]cGMP in the presence of 0.2mM IBMX, extracts from COS-7 cells transfected with pCDM8-cGB-PDE exhibited 8-fold higher cGMP-binding activity than extracts from mock-transfected cells. No IBMX stimulation of background cGMP binding was observed suggesting that little or no endogenous cGB-PDE was present in the COS-7 cell extracts. In extracts of pCDM8-cGB-PDE transfected cells cGMP-specific activity was stimulated approximately 1.8-fold by the addition of 0.2mM IBMX. The ability of IBMX to stimulate cGMP binding 2-5 fold is a distinctive property of the cGMP-binding phosphodisterases.

Cell extracts were assayed as described above for [^{3}H]cGMP-binding activity (wherein concentration of [^{3}H]cGMP was 2.5μM) in the presence of excess unlabelled cAMP or cGMP. Results are presented in FIGURE 8 wherein cGMP binding in the absence of unlabelled competitor was taken as 100% and each data

point represents the average of three separate determinations. The binding activity of the protein product encoded by the cGB-PDE cDNA was specific for cGMP relative to cAMP. Less than 10-fold higher concentrations of unlabelled cGMP were required to inhibit [^{3}H]cGMP binding activity by 50% whereas approximately 100-fold higher concentrations of cAMP were required for the same degree of inhibition.

The results presented in this example show that the cGB-PDE cDNA encodes a phosphodiesterase which possesses biochemical activities characteristic of native cGB-PDE.

The catalytic domains of mammalian PDEs and a *Drosophila* PDE contain two tandem conserved sequences ($HX_3HX_{24-26}E$) that are typical Zn^{2+}-binding motifs in Zn^{2+} hydrolases such as thermolysin [Vallee and Auld, *Biochem., 29*: 5647-5659 (1990)]. cGB-PDE binds Zn^{2+} in the presence of large excesses of Mg^{2+}, Mn^{2+}, Fe^{2+}, Fe^{3+}, Ca^{2+} or Cd^{2+}. In the absence of added metal, cGB-PDE has a PDE activity that is approximately 20% of the maximum activity that occurs in the presence of 40 mM Mg^{2+}, and this basal activity is inhibited by 1,10-phenanthroline or EDTA. This suggests that a trace metal(s) accounts for the basal PDE activity despite exhaustive treatments to remove metals. PDE activity is stimulated by addition of Zn^{2+} (0.02-1 μM) or Co^{2+} (1-20 μM), but not by Fe^{2+}, Fe^{3+}, Ca^{2+}, Cd^{2+}, or Cu^{2+}. Zn^{2+} increases the basal PDE activity up to 70% of the maximum stimulation produced by 40mM Mg^{2+}. The stimulatory effect of Zn^{2+} in these assays may be compromised by an inhibitory effect that is caused by Zn^{2+} concentrations >1 μM. The Zn^{2+}-supported PDE activity and Zn^{2+} binding by cGB-PDE occur at similar concentrations of Zn^{2+}. cGB-PDE thus appears to be a Zn^{2+} hydrolase and Zn^{2+} appears to play a critical role in the activity of the enzyme. See, Colbran *et al.*, *The FASEB J.*, *8*: Abstract 2148 (March 15, 1994).

Example 6

Several human cDNA clones, homologous to the bovine cDNA clone encoding cGB-PDE, were isolated by hybridization under stringent conditions using a nucleic acid probe corresponding to a portion of the bovine cGB-8 clone (nucleotides 489-1312 of SEQ ID NO: 9).

Isolation of cDNA Fragments Encoding Human cGB-PDE

Three human cDNA libraries (two glioblastoma and one lung) in the vector lambda Zap were probed with the bovine cGB-PDE sequence. The PCR-generated clone corresponding to nucleotides 484-1312 of SEQ ID NO: 9 which is described in Example 1 was digested with *Eco*RI and *Sal*I and the resulting 0.8 kb cDNA insert was isolated and purified by agarose gel electrophoresis. The fragment was labelled with radioactive nucleotides using a random primed DNA labelling kit (Boehringer).

The cDNA libraries were plated on 150 mm petri plates at a density of approximately 50,000 plaques per plate. Duplicate nitrocellulose filter replicas were prepared. The prehybridization buffer was 3X SSC, 0.1% sarkosyl, 10X Denhardt's, 20mM sodium phosphate (pH 6.8) and 50 μg/ml salmon testes DNA. Prehybridization was carried out at 65°C for a minimum of 30 minutes. Hybridization was carried out at 65°C overnight in buffer of the same composition with the addition of 1-5x10^5 cpm/ml of probe. The filters were washed at 65°C in 2X SSC, 0.1% SDS. Hybridizing plaques were detected by autoradiography. The number of cDNAs that hybridized to the bovine probe and the number of cDNAs screened are indicated in Table 2 below.

Table 2

cDNA Library	Type	Positive Plaques	Plaques Screened
Human SW 1088 glioblastoma	dT-primed	1	1.5x10^6
Human lung	dT-primed	2	1.5x10^6
Human SW 1088 glioblastoma	dT-primed	4	1.5x10^6

Plasmids designated cgbS2.1, cgbS3.1, cgbL23.1, cgbL27.1 and cgbS27.1 were excised *in vivo* from the lambda Zap clones and sequenced.

Clone cgbS3.1 contains 2060 bp of a PDE open reading frame followed by a putative intron. Analysis of clone cgbS2.1 reveals that it corresponds to clone

cgbS3.1 positions 664 to 2060 and extends the PDE open reading frame an additional 585 bp before reading into a putative intron. The sequences of the putative 5′ untranslated region and the protein encoding portions of the cgbS2.1 and cgbS3.1 clones are set out in SEQ ID NOs: 11 and 12, respectively. Combining the two cDNAs yields a sequence containing approximately 2.7 kb of an open reading encoding a PDE. The three other cDNAs did not extend any further 5′ or 3′ than cDNA cgbS3.1 or cDNA cgbS2.1.

To isolate additional cDNAs, probes specific for the 5′ end of clone cgbS3.1 and the 3′ end of clone cgbS2.1 were prepared and used to screen a SW1088 glioblastoma cDNA library and a human aorta cDNA library. A 5′ probe was derived from clone cgbS3.1 by PCR using the primers cgbS3.1S311 and cgbL23.1A1286 whose sequences are set out in SEQ ID NOs: 8 and 9, respectively, and below.

Primer cgbS3.1S311 (SEQ ID NO: 13)

5′ GCCACCAGAGAAATGGTC 3′

Primer cgbL23.1A1286 (SEQ ID NO: 14)

5′ ACAATGGGTCTAAGAGGC 3′

The PCR reaction was carried out in a 50 ul reaction volume containing 50 pg cgbS3.1 cDNA, 0.2mM dNTP, 10 ug/ml each primer, 50 mM KCl, 10mM Tris-HCl pH 8.2, 1.5mM $MgCl_2$ and Taq polymerase. After an initial four minute denaturation at 94°C, 30 cycles of one minute at 94°C, two minutes at 50°C and four minutes at 72°C were carried out. An approximately 0.2 kb fragment was generated by the PCR reaction which corresponded to nucleotides 300-496 of clone cgbS3.1.

A 3′ probe was derived from cDNA cgbS2.1 by PCR using the oligos cgbL23.1S1190 and cgbS2.1A231 whose sequences are set out below.

Primer cgbL23.1S1190 (SEQ ID NO: 15)

5′ TCAGTGCATGTTTGCTGC 3′

Primer cgbS2.1A231 (SEQ ID NO: 16)

5′ TACAAACATGTTCATCAG 3′

The PCR reaction as carried out similarly to that described above for generating the 5′ probe, and yielded a fragment of approximately 0.8kb corresponding to nucleotides

1358-2139 of cDNA cgbS2.1. The 3′ 157 nucleotides of the PCR fragment (not shown in SEQ ID NO: 12) are within the presumptive intron.

The two PCR fragments were purified and isolated by agarose gel electrophoresis, and were labelled with radioactive nucleotides by random priming. A random-primed SW1088 glioblastoma cDNA library ($1.5x10^6$ plaques) was screened with the labelled fragments as described above, and 19 hybridizing plaques were isolated. An additional 50 hybridizing plaques were isolated from a human aorta cDNA library (dT and random primed, Clontech, Palo Alto, CA).

Plasmids were excised *in vivo* from some of the positive lambda Zap clones and sequenced. A clone designated cgbS53.2, the sequence of which is set out in SEQ ID NO: 17, contains an approximately 1.1 kb insert whose sequence overlaps the last 61 bp of cgbS3.1 and extends the open reading frame an additional 135 bp beyond that found in cgbS2.1. The clone contains a termination codon and approximately 0.3 kB of putative 3′ untranslated sequence.

Generation of a Composite cDNA Encoding Human cGB-PDE

Clones cgbS3.1, cgbS2.1 and cgbS53.2 were used as described in the following paragraphs to build a composite cDNA that contained a complete human cGB-PDE opening reading frame. The composite cDNA is designated cgbmet156-2 and was inserted in the yeast ADH1 expression vector pBNY6N.

First, a plasmid designated cgb stop-2 was generated that contained the 3′ end of the cGB-PDE open reading frame. A portion of the insert of the plasmid was generated by PCR using clone cgbS53.2 as a template. The PCR primers utilized were cgbS2.1S1700 and cgbstop-2.

Primer cgbS2.1S1700 (SEQ ID NO: 18)

5′ TTTGGAAGATCCTCATCA 3′

Primer cgbstop-2 (SEQ ID NO: 19)

5′ ATGTCTCGAGTCAGTTCCGCTTGGCCTG 3′

The PCR reaction was carried out in 50 ul containing 50 pg template DNA, 0.2mM dNTPs, 20mM Tris-HCl pH 8.2, 10mM KCl, 6mM $(NH_4)_2SO_4$, 1.5mM $MgCl_2$, 0.1% Triton-X-100, 500ng each primer and 0.5 units of Pfu polymerase (Stratagene). The reaction was heated to 94°C for 4 minutes and then 30 cycles of 1 minute at 94°C, 2 minutes at 50°C and four minutes at 72°C were performed. The polymerase

was added during the first cycle at 50°C. The resulting PCR product was phenol/chloroform extracted, chloroform extracted, ethanol precipitated and cut with the restriction enzymes *BclI* and *XhoI*. The restriction fragment was purified on an agarose gel and eluted.

This fragment was ligated to the cDNA cgbS2.1 that had been grown in dam⁻ *E. coli*, cut with the restriction enzymes *BclI* and *XhoI*, and gel-purified using the Promega magic PCR kit. The resulting plasmid was sequenced to verify that cgbstop-2 contains the 3′ portion of the cGB-PDE open reading frame.

Second, a plasmid carrying the 5′ end of the human cGB-PDE open reading frame was generated. Its insert was generated by PCR using clone cgbS3.1 as a template. PCR was performed as described above using primers cgbmet156 and cgbS2.1A2150.

Primer cgbmet156 (SEQ ID NO: 20)

5′ TACAGAATTCTGACCATGGAGCGGGCCGGC 3′

Primer cgbS2.1A2150 (SEQ ID NO: 21)

5′ CATTCTAAGCGGATACAG 3′

The resulting PCR fragment was phenol/choloform extracted, choloform extracted, ethanol precipitated and purified on a Sepharose CL-6B column. The fragment was cut with the restriction enzymes *Eco*RV and *Eco*RI, run on an agarose gel and purified by spinning through glass wool. Following phenol/chloroform extraction, chloroform extraction and ethanol precipitation, the fragment was ligated into *Eco*RI/*Eco*RV digested BluescriptII SK(+) to generate plasmid cgbmet156. The DNA sequence of the insert and junctions was determined. The insert contains a new *Eco*RI site and an additional 5 nucleotides that together replace the original 155 nucleotides 5′ of the initiation codon. The insert extends to an *Eco*RV site beginning 531 nucleotides from the initiation codon.

The 5′ and 3′ portions of the cGB-PDE open reading frame were then assembled in vector pBNY6a. The vector pBNY6a was cut with *Eco*RI and *Xho*I, isolated from a gel and combined with the agarose gel purified *Eco*RI/*Eco*RV fragment from cgbmet156 and the agarose gel purified *Eco*RV/*Xho*I fragment from cgbstop-2. The junctions of the insert were sequenced and the construct was named hcbgmet156-2 6a.

The cGB-PDE insert from hcbgmet156-2 6a was then moved into the expression vector pBNY6n. Expression of DNA inserted in this vector is directed from the yeast ADH1 promoter and terminator. The vector contains the yeast 2 micron origin of replication, the pUC19 origin of replication and an ampicillan resistance gene. Vector pBNY6n was cut with *Eco*RI and *Xho*I and gel-purified. The EcoRI/XhoI insert from hcgbmet156-2 6a was gel purified using Promega magic PCR columns and ligated into the cut pBNY6n. All new junctions in the resulting construct, hcgbmet156-2 6n, were sequenced. The DNA and deduced amino acid sequences of the insert of hcgbmet156-2 6n which encodes a composite human cGB-PDE is set out in SEQ ID NOs: 22 and 23. The insert extends from the first methionine in clone cgbS3.1 (nucleotide 156) to the stop codon (nucleotide 2781) in the composite cDNA. Because the methionine is the most 5′ methionine in clone cgbS3.1 and because there are no stop codons in frame with the methionine and upstream of it, the insert in pBNY6n may represent a truncated form of the open reading frame.

Variant cDNAs

Four human cGB-PDE cDNAs that are different from the hcgbmet156-2 6n composite cDNA have been isolated. One cDNA, cgbL23.1, is missing an internal region of hcgbmet156-2 6n (nucleotides 997-1000 to 1444-1447). The exact end points of the deletion cannot be determined from the cDNA sequence at those positions. Three of the four variant cDNAs have 5' end sequences that diverge from the hcgbmet156-2 6n sequence upstream of nucleotide 151 (cDNAs cgbA7f, cgbA5C, cgbI2). These cDNAs presumably represent alteratively spliced or unspliced mRNAs.

Example 7

The composite human cGB-PDE cDNA construct, hcgbmet156-2 6n, was transformed into the yeast strain YKS45 (ATCC 74225) (MATα his3 trp1 ura3 leu3 pde1::HIS3 pde2::TRP1) in which two endogenous PDE genes are deleted. Transformants complementing the leu$^-$ deficiency of the YKS45 strain were selected and assayed for cGB-PDE activity. Extracts from cells bearing the plasmid hcgbmet156-2 6n were determined to display cyclic GMP-specific phosphodiesterase activity by the assay described below.

One liter of YKS45 cells transformed with the plasmid cgbmet156-2 6n and grown in SC-leu medium to a density of 1-2x10^7 cells/ml was harvested by centrifugation, washed once with deionized water, frozen in dry ice/ethanol and stored at -70°C. Cell pellets (1-1.5 ml) were thawed on ice in the presence of an equal volume of 25mM Tris-Cl (pH 8.0)/5mM EDTA/5mM EGTA/1mM o-phenanthroline/0.5mM AEBSF (Calbiochem)/0.1% β-mercaptoethanol and 10 ug/ml each of aprotinin, leupeptin, and pepstatin A. The thawed cells were added to 2 ml of acid-washed glass beads (425-600μM, Sigma) in 15 ml Corex tube. Cells were broken with 4 cycles consisting of a 30 second vortexing on setting 1 followed by a 60 second incubation on ice. The cell lysate was centrifuged at 12,000 x g for 10 minutes and the supernatant was passed through a 0.8 μ filter. The supernatant was assayed for cGMP PDE activity as follows. Samples were incubated for 20 minutes at 30°C in the presence of 45mM Tris-Cl (pH 8.0), 2mM EGTA, 1mM EDTA, 0.2mg/ml BSA, 5mM $MgCl_2$, 0.2mM o-phenanthroline, 2ug/ml each of pepstatin A, leupeptin, and aprotinin, 0.1mM AEBSF, 0.02% β-mercaptoethanol and 0.1mM [^{3}H]cGMP as substrate. [^{14}C]-AMP (0.5 nCi/assay) was added as a recovery standard. The reaction was terminated with stop buffer (0.1M ethanolamine pH 9.0, 0.5M ammonium sulfate, 10mM EDTA, 0.05% SDS final concentration). The product was separated from the cyclic nucleotide substrate by chromatography on BioRad Affi-Gel 601. The sample was applied to a column containing approximately 0.25 ml of Affi-Gel 601 equilibrated in column buffer (0.1M ethanolamine pH 9.0 containing 0.5M ammonium sulfate). The column was washed five times with 0.5 ml of column buffer. The product was eluted with four 0.5 ml aliquots of 0.25 acetic acid and mixed with 5 ml Ecolume (ICN Biochemicals). The radioactive product was measured by scintillation counting.

Example 8

Analysis of expression of cGB-PDE mRNA in human tissues was carried out by RNase protection assay.

A probe corresponding to a portion of the putative cGMP binding domain of cGB-PDE (402 bp corresponding to nucleotides 1450 through 1851 of SEQ ID NO: 13) was generated by PCR. The PCR fragment was inserted into the *Eco*RI

site of the plasmid pBSII SK(-) to generate the plasmid RP3. RP3 plasmid DNA was linearized with *Xba*I and antisense probes were generated by a modification of the Stratagene T7 RNA polymerase kit. Twenty-five ng of linearized plasmid was combined with 20 microcuries of alpha ^{32}P rUTP (800 Ci/mmol, 10 mCi/ml), 1X transcription buffer (40mM TrisCl, pH 8, 8mM $MgCl_2$, 2mM spermidine, 50mM NaCl), 0.25mM each rATP, rGTP and rCTP, 0.1 units of RNase Block II, 5mM DTT, 8μM rUTP and 5 units of T7 RNA Polymerase in a total volume of 5 μl. The reaction was allowed to proceed 1 hour at room temperature and then the DNA template was removed by digestion with RNase free DNase. The reaction was diluted into 100 μl of 40mM TrisCl, pH 8, 6mM $MgCl_2$ and 10mM NaCl. Five units of RNase-free DNase were added and the reaction was allowed to continue another 15 minutes at 37°C. The reaction was stopped by a phenol extraction followed by a phenol chloroform extraction. One half volume of 7.5M NH_4OAc was added and the probe was ethanol precipitated.

The RNase protection assays were carried out using the Ambion RNase Protection kit (Austin, TX) and 10 μg RNA isolated from human tissues by an acid guanidinium extraction method. Expression of cGB-PDE mRNA was easily detected in RNA extracted from skeletal muscle, uterus, bronchus, skin, right saphenous vein, aorta and SW1088 glioblastoma cells. Barely detectable expression was found in RNA extracted from right atrium, right ventricle, kidney cortex, and kidney medulla. Only complete protection of the RP3 probe was seen. The lack of partial protection argues against the cDNA cgbL23.1 (a variant cDNA described in Example 7) representing a major transcript, at least in these RNA samples.

Example 9

Polyclonal antisera was raised to *E. coli*-produced fragments of the human cGB-PDE.

A portion of the human cGB-PDE cDNA (nucleotides 1668-2612 of SEQ ID NO: 22, amino acids 515-819 of SEQ ID NO: 23) was amplified by PCR and inserted into the *E. coli* expression vector pGEX2T (Pharmacia) as a *BamHI/EcoR*I fragment. The pGEX2T plasmid carries an ampicillin resistance gene, an *E. coli* laq I^q gene and a portion of the *Schistosoma japonicum* glutathione-S-

transferase (GST) gene. DNA inserted in the plasmid can be expressed as a fusion protein with GST and can then be cleaved from the GST portion of the protein with thrombin. The resulting plasmid, designated cgbPE3, was transformed into *E. coli* strain LE392 (Stratagene). Transformed cells were grown at 37°C to an OD600 of 0.6. IPTG (isopropylthioalactopyranoside) was added to 0.1mM and the cells were grown at 37°C for an additional 2 hours. The cells were collected by centrifugation and lysed by sonication. Cell debris was removed by centrifugation and the supernatant was fractionated by SDS-PAGE. The gel was stained with cold 0.4M KCl and the GST-cgb fusion protein band was excised and electroeluted. The PDE portion of the protein was separated from the GST portion by digestion with thrombin. The digest was fractionated by SDS-PAGE, the PDE protein was electroeluted and injected subcutaneously into a rabbit. The resultant antisera recognizes both the bovine cGB-PDE fragment that was utilized as antigen and the full length human cGB-PDE protein expressed in yeast (see Example 8).

Example 10

Polynucleotides encoding various cGB-PDE analogs and cGB-PDE fragments were generated by standard methods.

A. cGB-PDE Analogs

All known cGMP-binding PDEs contain two internally homologous tandem repeats within their putative cGMP-binding domains. In the bovine cGB-PDE of the invention, the repeats span at least residues 228-311 (repeat A) and 410-500 (repeat B) of SEQ ID NO: 10. Site-directed mutagenesis of an aspartic acid that is conserved in repeats A and B of all known cGMP-binding PDEs was used to create analogs of cGB-PDE having either Asp-289 replaced with Ala (D289A) or Asp-478 replaced with Ala (D478A). Recombinant wild type (WT) bovine and mutant bovine cGB-PDEs were expressed in COS-7 cells. cGB-PDE purified from bovine lung (native cGB-PDE) and WT cGB-PDE displayed identical cGMP-binding kinetics with a K_d of approximately 2 μM and a curvilinear dissociation profile ($t_{½}$ = 1.3 hours at 4°C). This curvilinearity may have been due to the presence of distinct high affinity (slow) and low affinity (fast) sites of cGMP binding. The D289A mutant had significantly decreased affinity for cGMP (K_d > 20μM) and a single rate of cGMP-

association ($t_{½}$ = 0.5 hours), that was similar to that calculated for the fast site of WT and native cGB-PDE. This suggested the loss of a slow cGMP-binding site in repeat A of this mutant. Conversely, the D478A mutant showed higher affinity for cGMP (K_d of approximately 0.5 μM) and a single cGMP-dissociation rate ($t_{½}$ = 2.8 hours) that was similar to the calculated rate of the slow site of WT and native cGB-PDE. This suggested the loss of a fast site when repeat B was modified. These results indicate that dimeric cGB-PDE possesses two homologous but kinetically distinct cGMP-binding sites, with the conserved aspartic acid being critical for interaction with cGMP at each site. See, Colbran *et al.*, *FASEB J.*, *8*: Abstract 2149 (May 15, 1994).

B. Amino-Terminal Truncated cGB-PDE Polypeptides

A truncated human cGB-PDE polypeptide including amino acids 516-875 of SEQ ID NO: 23 was expressed in yeast. A cDNA insert extending from the NcoI site at nucleotide 1555 of SEQ ID NO: 22 through the XhoI site at the 3' end of SEQ ID NO: 22 was inserted into the ADH2 yeast expression vector YEpC-PADH2d [Price *et al.*, *Meth. Enzymol.*, *185*: 308-318 (1990)] that had been digested with NcoI and SalI to generate plasmid YEpC-PADH2d HcGB. The plasmid was transformed into spheroplasts of the yeast strain yBJ2-54 (prc1-407 prb1-1122 pep4-3 leu2 trp1 ura3-52 Δpde1::URA3, HIS3 Δpde2::TRP1 cir°). The endogenous PDE genes are deleted in this strain. Cells were grown in SC-leu media with 2% glucose to 10^7 cells/ml, collected by filtration and grown 24 hours in YEP media containing 3% glycerol. Cells were pelleted by centrifugation and stored frozen. Cells were disrupted with glass beads and the cell homogenate was assayed for phosphodiesterase activity essentially as described in Prpic *et al.*, *Anal. Biochem.*, *208*: 155-160 (1993). The truncated human cGB-PDE polypeptide exhibited phosphodiesterase activity.

C. Carboxy-Terminal Truncated cGB-PDE Polypeptides

Two different plasmids encoding carboxy-terminal truncated human cGB-PDE polypeptides were constructed.

Plasmid pBJ6-84Hin contains a cDNA encoding amino acids 1-494 of SEQ ID NO: 23 inserted into the NcoI and SalI sites of vector YEpC-PADH2d. The cDNA insert extends from the NcoI site at nucleotide position 10 of SEQ ID NO: 22

through the HindIII site at nucleotide position 1494 of SEQ ID NO: 22 followed by a linker and the SalI site of YEpC-PADH2d.

Plasmid pBJ6-84Ban contains a cDNA encoding amino acids 1-549 of SEQ ID NO: 23 inserted into the NcoI and SalI sites of vector YEpC-PADH2d. The cDNA insert extends from the NcoI site at nucleotide position 10 of SEQ ID NO: 22 through the BanI site at nucleotide position 1657 of SEQ ID NO: 22 followed by a linker and the SalI site of YEpC-PADH2d.

The trucated cGB-PDE polypeptides are useful for screening for modulators of cGB-PDE activity.

Example 11

Monoclonal antibodies reactive with human cGB-PDE were generated.

Yeast yBJ2-54 containing the plasmid YEpADH2 HcGB (Example 10B) were fermented in a New Brunswick Scientific 10 liter Microferm. The cGB-PDE cDNA insert in plasmid YEpADH2 HcGB extends from the NcoI site at nucleotide 12 of SEQ ID NO: 22 to the XhoI site at the 3′ end of SEQ ID NO: 22. An inoculum of 4 x 10^9 cells was added to 8 liters of media containing SC-leu, 5% glucose, trace metals, and trace vitamins. Fermentation was maintained at 26°C, agitated at 600 rpm with the standard microbial impeller, and aerated with compressed air at 10 volumes per minute. When glucose decreased to 0.3% at 24 hours post-inoculation the culture was infused with 2 liters of 5X YEP media containing 15% glycerol. At 66 hours post-inoculation the yeast from the ferment was harvested by centrifugation at 4,000 x g for 30 minutes at 4°C. Total yield of biomass from this fermentation approached 350 g wet weight.

Human cGB-PDE enzyme was purified from the yeast cell pellet. Assays for PDE activity using 1 mM cGMP as substrate was employed to follow the chromatography of the enzyme. All chromatographic manipulations were performed at 4°C.

Yeast (29g wet weight) were resuspended in 70ml of buffer A (25mM Tris pH 8.0, 0.25mM DTT, 5mM $MgCl_2$, 10μM $ZnSO^4$, 1mM benzamidine) and lysed by passing through a microfluidizer at 22-24,000 psi. The lysate was centrifuged at 10,000 x g for 30 minutes and the supernatant was applied to a 2.6 x

28 cm column containing Pharmacia Fast Flow Q anion exchange resin equilibrated with buffer B containing 20mM BisTris-propane pH 6.8, 0.25mM DTT, 1mM $MgCl_2$, and 10μM $ZnSO_4$. The column was washed with 5 column volumes of buffer B containing 0.125M NaCl and then developed with a linear gradient from 0.125 to 1.0M NaCl. Fractions containing the enzyme were pooled and applied directly to a 5 x 20 cm column of ceramic hydroxyapatite (BioRad) equilibrated in buffer C containing 20mM BisTris-propane pH 6.8, 0.25mM DTT, 0.25MKCl, 1mM $MgCl_2$, and 10μM $ZnSO_4$. The column was washed with 5 column volumes of buffer C and eluted with a linear gradient from 0 to 250mM potassium phosphate in buffer C. The pooled enzyme was concentrated 8-fold by ultrafiltration (YM30 membrane, Amicon). The concentrated enzyme was chromatographed on a 2.6 x 90 cm column of Pharmacia Sephacryl S300 (Piscataway, NJ) equilibrated in 25mM BisTris-propane pH 6.8, 0.25mM DTT, 0.25M NaCl, 1mM $MgCl_2$, and 20μM $ZnSO_4$. Approximately 4 mg of protein was obtained. The recombinant human cGB-PDE enzyme accounted for approximately 90% of protein obtained as judged by SDS polyacrylamide gel electrophoresis followed by Coomassie blue staining.

The purified protein was used as an antigen to raise monoclonal antibodies. Each of 19 week old Balb/c mice (Charles River Biotechnical Services, Inc., Wilmington, Mass.) was immunized sub-cutaneously with 50 ug purified human cGB-PDE enzyme in a 200 ul emulsion consisting of 50% Freund's complete adjuvant (Sigma Chemical Co.). Subsequent boosts on day 20 and day 43 were administered in incomplete Freund's adjuvant. A pre-fusion boost was done on day 86 using 50 ug enzyme in PBS. The fusion was performed on day 90.

The spleen from mouse #1817 was removed sterilely and placed in 10ml serum free RPMI 1640. A single-cell suspension was formed and filtered through sterile 70-mesh Nitex cell strainer (Becton Dickinson, Parsippany, New Jersey), and washed twice by centrifuging at 200 g for 5 minutes and resuspending the pellet in 20 ml serum free RPMI. Thymocytes taken from 3 naive Balb/c mice were prepared in a similar manner.

NS-1 myeloma cells, kept in log phase in RPMI with 11% Fetalclone (FBS) (Hyclone Laboratories, Inc., Logan, Utah) for three days prior to fusion, were centrifuged at 200 g for 5 minutes, and the pellet was washed twice as described in

the foregoing paragraph. After washing, each cell suspension was brought to a final volume of 10 ml in serum free RPMI, and 20 μl was diluted 1:50 in 1 ml serum free RPMI. 20 μl of each dilution was removed, mixed with 20 μl 0.4% trypan blue stain in 0.85% saline (Gibco), loaded onto a hemocytometer (Baxter Healthcare Corp., Deerfield, Illinois) and counted.

Two x 10^8 spleen cells were combined with 4.0 x 10^7 NS-1 cells, centrifuged and the supernatant was aspirated. The cell pellet was dislodged by tapping the tube and 2 ml of 37°C PEG 1500 (50% in 75 mM Hepes, pH 8.0) (Boehringer Mannheim) was added with stirring over the course of 1 minute, followed by adding 14 ml of serum free RPMI over 7 minutes. An additional 16 ml RPMI was added and the cells were centrifuged at 200 g for 10 minutes. After discarding the supernatant, the pellet was resuspended in 200 ml RPMI containing 15% FBS, 100 μM sodium hypoxanthine, 0.4 μM aminopterin, 16 μM thymidine (HAT) (Gibco), 25 units/ml IL-6 (Boehringer Mannheim) and 1.5 x 10^6 thymocytes/ml. The suspension was first placed in a T225 flask (Corning, United Kingdom) at 37°C for two hours before being dispensed into ten 96-well flat bottom tissue culture plates (Corning, United Kingdom) at 200 μl/well. Cells in plates were fed on days 3, 4, 5 post fusion day by aspirating approximately 100 μl from each well with an 20 G needle (Becton Dickinson), and adding 100 μl/well plating medium described above except containing 10 units/ml IL-6 and lacking thymocytes.

The fusion was screened initially by ELISA. Immulon 4 plates (Dynatech) were coated at 4°C overnight with purified recombinant human cGB-PDE enzyme (100ng/well in 50mM carbonate buffer pH9.6). The plates were washed 3X with PBS containing 0.05% Tween 20 (PBST). The supernatants from the individual hybridoma wells were added to the enzyme coated wells (50 μl/well). After incubation at 37°C for 30 minutes, and washing as above, 50 μl of horseradish peroxidase conjugated goat anti-mouse IgG(fc) (Jackson ImmunoResearch, West Grove, Pennsylvania) diluted 1:3500 in PBST was added. Plates were incubated as above, washed 4X with PBST and 100 μl substrate consisting of 1 mg/ml o-phenylene diamine (Sigma) and 0.1 μl/ml 30% H_2O_2 in 100 mM citrate, pH 4.5, was added. The color reaction was stopped in 5 minutes with the addition of 50 μl of 15% H_2SO_4. A_{490} was read on a plate reader (Dynatech).

Wells C5G, E4D, F1G, F9H, F11G, J4A, and J5D were picked and renamed 102A, 102B, 102C, 102D, 102E, 102F, and 102G respectively, cloned two or three times, successively, by doubling dilution in RPMI, 15% FBS, 100μM sodium hypoxanathine, 16μM thymidine, and 10 units/ml IL-6. Wells of clone plates were scored visually after 4 days and the number of colonies in the least dense wells were recorded. Selected wells of the each cloning were tested by ELISA.

The monoclonal antibodies produced by above hybridomas were isotyped in an ELISA assay. Results showed that monoclonal antibodies 102A to 102E were IgG1, 102F was IgG2b and 102G was IgG2a.

All seven monoclonal antibodies reacted with human cGS-PDE as determined by Western analysis.

Example 12

Developing modulators of the biological activities of specific PDEs requires differentiating PDE isozymes present in a particular assay preparation. The classical enzymological approach of isolating PDEs from natural tissue sources and studying each new isozyme is hampered by the limits of purification techniques and the inability to definitively assess whether complete resolution of a isozyme has been achieved. Another approach has been to identify assay conditions which might favor the contribution of one isozyme and minimize the contribution of others in a preparation. Still another approach has been the separation of PDEs by immunological means. Each of the foregoing approaches for differentiating PDE isozymes is time consuming and technically difficult. As a result many attempts to develop selective PDE modulators have been performed with preparations containing more than one isozyme. Moreover, PDE preparations from natural tissue sources are susceptible to limited proteolysis and may contain mixtures of active proteolytic products that have different kinetic, regulatory and physiological properties than the full length PDEs.

Recombinant cGB-PDE polypeptide products of the invention greatly facilitate the development of new and specific cGB-PDE modulators. The use of human recombinant enzymes for screening for modulators has many inherent advantages. The need for purification of an isozyme can be avoided by expressing

it recombinantly in a host cell that lacks endogenous phosphodiesterase activity (e.g., yeast strain YKS45 deposited as ATCC 74225). Screening compounds against human protein avoids complications that often arise from screening against non-human protein where a compound optimized on a non-human protein may fail to be specific for or react with the human protein. For example, a single amino acid difference between the human and rodent $5HT_{1B}$ serotonin receptors accounts for the difference in binding of a compound to the receptors. [See Oskenberg *et al., Nature, 360*: 161-163 (1992)]. Once a compound that modulates the activity of the cGB-PDE is discovered, its selectivity can be evaluated by comparing its activity on the cGB-PDE to its activity on other PDE isozymes. Thus, the combination of the recombinant cGB-PDE products of the invention with other recombinant PDE products in a series of independent assays provides a system for developing selective modulators of cGB-PDE. Selective modulators may include, for example, antibodies and other proteins or peptides which specifically bind to the cGB-PDE or cGB-PDE nucleic acid, oligonucleotides which specifically bind to the cGB-PDE (see Patent Cooperation Treaty International Publication No. WO93/05182 published March 18, 1993 which describes methods for selecting oligonucleotides which selectively bind to target biomolecules) or cGB-PDE nucleic acid (e.g., antisense oligonucleotides) and other non-peptide natural or synthetic compounds which specifically bind to the cGB-PDE or cGB-PDE nucleic acid. Mutant forms of the cGB-PDE which alter the enzymatic activity of the cGB-PDE or its localization in a cell are also contemplated. Crystallization of recombinant cGB-PDE alone and bound to a modulator, analysis of atomic structure by X-ray crystallography, and computer modelling of those structures are methods useful for designing and optimizing non-peptide selective modulators. See, for example, Erickson *et al., Ann. Rep. Med. Chem., 27:* 271-289 (1992) for a general review of structure-based drug design.

Targets for the development of selective modulators include, for example: (1) the regions of the cGB-PDE which contact other proteins and/or localize the cGB-PDE within a cell, (2) the regions of the cGB-PDE which bind substrate, (3) the allosteric cGMP-binding site(s) of cGB-PDE, (4) the metal-binding regions of the cGB-PDE, (5) the phosphorylation site(s) of cGB-PDE and (6) the regions of the cGB-PDE which are involved in dimerization of cGB-PDE subunits.

While the present invention has been described in terms of specific embodiments, it is understood that variations and modifications will occur to those skilled in the art. Accordingly, only such limitations as appear in the appended claims should be placed on the invention.

SEQUENCE LISTING

(1) GENERAL INFORMATION:

(i) APPLICANT: The Board of Regents of the University of Washington

(ii) TITLE OF INVENTION: Cyclic GMP-Binding, Cyclic GMP-Specific Phosphodiesterase Materials and Methods

(iii) NUMBER OF SEQUENCES: 23

(iv) CORRESPONDENCE ADDRESS:
(A) ADDRESSEE: Marshall, O'Toole, Gerstein, Murray & Borun
(B) STREET: 6300 Sears Tower, 233 S. Wacker Drive

INDICATIONS RELATING TO A DEPOSITED MICROORGANISM

(PCT Rule 13*bis*)

A. The indications made below relate to the microorganism referred to in the description on page 5, lines 6-9.

B. IDENTIFICATION OF DEPOSIT Further deposits are identified on an additional sheet ☐

Name of depositary institution

American Type Culture Collection

Address of depositary institution *(including postal code and country)*

12301 Parklawn Drive
Rockville, Maryland 20852
US

Date of deposit	Accession Number
4 May 1993	ATCC 69296

C. ADDITIONAL INDICATIONS *(leave blank if not applicable)* This information is continued on an additional sheet ☐

"In respect of those designations in which a European patent is sought, a sample of the deposited microorganism will be made available until the publication of the mention of the grant of the European patent or until the date on which the application has been refused or withdrawn or is deemed to be withdrawn, only by the issue of such a sample to an expert nominated by the person requesting the sample (Rule 23(4) EPC)."

D. DESIGNATED STATES FOR WHICH INDICATIONS ARE MADE *(if the indications are not for all designated States)*

EP

E. SEPARATE FURNISHING OF INDICATIONS *(leave blank if not applicable)*

The indications listed below will be submitted to the International Bureau later *(specify the general nature of the indications e.g., "Accession Number of Deposit")*

For receiving Office use only	For International Bureau use only

Form PCT/RO/134 (July 1992)

CLAIMS

1. A purified and isolated polynucleotide encoding cGB-PDE.

2. The polynucleotide of claim 1 which is a DNA sequence.

3. The DNA sequence of claim 2 which is a cDNA sequence or a biological replica thereof.

4. The DNA sequence of claim 2 which is a genomic DNA sequence or a biological replica thereof.

5. An RNA transcript of the genomic DNA sequence of claim 4.

6. The DNA sequence of claim 2 which is a wholly or partially chemically synthesized DNA sequence or a biological replica thereof.

7. The DNA sequence of claim 4 further comprising an endogenous expression control DNA sequence.

8. A DNA vector comprising a DNA sequence according to claim 2.

9. The vector of claim 8 wherein said DNA sequence is operatively linked to an expression control DNA sequence.

10. A host cell stably transformed or transfected with a DNA sequence according to claim 7 in a manner allowing the expression in said host cell of cGB-PDE polypeptide possessing a ligand/receptor binding biological activity or immunological property specific to cGB-PDE.

11. A method for producing cGB-PDE polypeptide, said method comprising growing a host cell according to claim 10 in a suitable nutrient medium and isolating cGB-PDE polypeptide from said cell or the medium of its growth.

12. A polypeptide or peptide capable of specifically binding to cGB-PDE.

13. An antibody substance according to claim 12.

14. A monoclonal antibody according to claim 13.

15. A hybridoma cell line producing a monoclonal antibody according to claim 14.

16. A humanized antibody substance according to claim 13.

17. An antisense polynucleotide specific for a polynucleotide encoding cGB-PDE.

18. A DNA sequence encoding cGB-PDE and selected from the group consisting of:

(a) the DNA sequence set out in SEQ ID NO: 9 or 22;

(b) a DNA which hybridizes under stringent conditions to the DNA of (a); and

(c) a DNA sequence which, but for the redundancy of the genetic code, would hybridize under stringent conditions to a DNA sequence of (a) or (b).

INTERNATIONAL SEARCH REPORT

Int nal Application No
PCT/US 94/06066

A. CL.'SSIFICATION OF SUBJECT MATTER
IPC 5 C12N15/55 C12N9/16 C12P21/08 C12N15/11

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 5 C12N C12P

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	JOURNAL OF BIOLOGICAL CHEMISTRY., vol.265, no.25, 5 September 1990, BALTIMORE US pages 14971 - 14978 THOMAS ETAL. 'Substrate- and Kinase-directed regulation of Phosphorylation of a cGMP-binding Phosphodiesterase by cGMP.' cited in the application see the whole document --- -/--	1-18

[X] Further documents are listed in the continuation of box C. [ ] Patent family members are listed in annex.

* Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family
